

Dual-Flow PBR Assembly

The Dual-Flow PBR Assembly offers all standard dual capabilities without restriction. In this assembly, the lower zone can be produced through a PBR or packer installed just above the lower production area.

The upper zone is produced through the Dual-Flow Assembly incorporating PBR seals. This upper receptacle is usually run in conjunction with a liner hanger or a liner tie-back.

The separate seal assemblies on each string allow them to move independently in response to pressure and temperature. The TIW Dual-Flow PBR Assembly can be used in a variety of applications, both dual and single completions including injection, stimulation, kill string and continuous treatment.
