

JE-PR Retrievable Packer

Product: JE-PR Packer

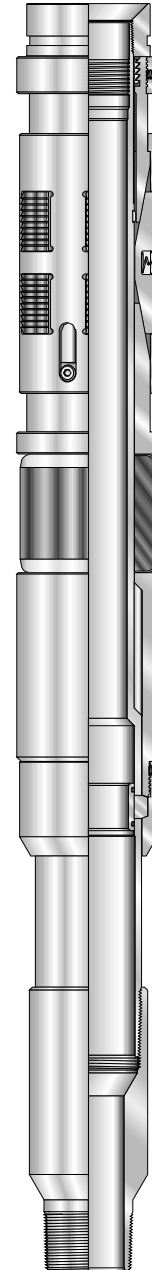

Type: Retrievable/Seal Bore

Set: Mechanical, Hydraulic or Wireline

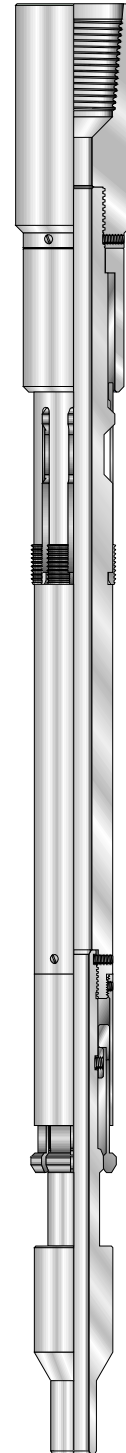

The TIW JE-PR Packer combines the features and benefits of a permanent packer with the flexibility of a retrievable one. The packer can be run and set with electric wireline or tubing using mechanical or hydraulic setting tools. Engineered and manufactured for high-pressure production packer applications, the JE-PR Retrievable Packer is recommended for shallow, deep or horizontal wells where a premium permanent packer would normally be used, but in which the operator requires retrieving capabilities.

Advantages

- The shorter length of the tool facilitates usage in high-angle or horizontal wells.
- Caged slips are protected during run-in.
- Easily retrievable because the slips, cones and all moving parts are isolated from the production fluids.
- Bi-directional slips effectively anchor the packer in place, holding the packoff in compression, making it resistant to movement from either direction, independent of tubing forces or differential pressure.
- Optional bore sizes accommodate large diameter tubing and provide greater production capacity.
- Gold Seal Packoff Rings ensure a positive high-pressure seal.
