

Tubing Seal Accessories

Locator Tubing Seal Assembly

This tool is designed to provide a positive indication that the seals have been properly located within the seal bore. Although the basic assembly includes two sets of seals, TIW can supply any number of seal units for added length.

The Locator Tubing Seal Assembly can be used with all TIW Seal-Bore Packers. Production tubes, tailpipes or other accessories having O.D.s compatible with the packer bore can be run below this assembly.

Positive Latch Tubing Seal Assembly

This TIW Assembly anchors the tubing string to the packer. Its use is recommended in wells where it is desirable to place the tubing in tension. The Positive Latch Assembly is for use with the SS, SS-BB, HB-BP and HB-BPR Packers. Production tubes, tailpipes or other accessories can be run below this assembly.

Knock-Out, Plug-Type Production Tube

For temporary conversion to a bridge plug. Plug is knocked out with the production tube to open the packer for production.

Lead-In, Sub-Type Production Tube

Run at the bottom of the production tubing string, this tube facilitates the entry of the seals into the packer.

Perforated-Type Production Tube

Run at the bottom of the production tubing string, this tube acts as a stinger. Production flows through the perforations in this tube.
